The congress participants' final explanation of the international Congress of Radiation Experts from December 10th till December 14th in Foz de Iguazu (Brasil)

Dear Mr. President,

Referring to our letter from November 12th, Mr. Frölich, who is still staying in Argentina, sends you the enclosed final explanation, which content does not admit any doubt about the danger for our health caused by harmful influences.

The examinations in Pato Branco, Brasil, are still going on. They find a lot of approval by the people living there. Already, that has lead to smaller discharges of the social sanitary institutions.

Mr. Frölich hopes, that all countries of the world will be stimulated to attempt something alike somewhere, so that the disknowledge of the danger will be put to an end.

With kind regards,

Yours sincerely,

in order of the President of
the Foundation

(A. Riedlberger, Secretary)

December 1992

Resumèe of the International Congress in Foz de Iguazu (Brasil) from December 10th till December 14th 1992 and the resulting recommendations:

Because of scientific perceptions of biology for buildings and geobiology the sanitary disadvantageous influence of geopathogene zones cannot be denied.

Because of scientific perceptions of the electrobiology and numerous epidemic studies in various countries, the sanitary disadvantageous influence of electromagnetic fields cannot be denied.

Thus, the resulting conclusions and recommendations:

- 1) Building land should be tested for sanitary harmful geopathogene zones and for electromagnetic disturbing fields by competent radioesthesists, respectively technicians of house examination of the geobiology, before the houses are built.
- 2) In houses already built, the tests named in 1) should be carried out in sleeping, resp. working areas.
- 3) Leads of high voltage shouldn't be built above houses, but as many meters beside the house as kilovolt voltage is lead.
- 4) The power supply of houses shouldn't be realized by a roof construction, but by earth cables.
- 5) The power supply of sleeping rooms should be turned off by fuses or a mains area switch (blocker of the current in this room).
- 6) Bedleads, bedrosts and matrèsses of beds should be free of metal.
- 7) To ascertain the influence of electric and magnetic fields on a person, a measurement of the capacitive link to the person is recommended.
- 8) For monitors, low radiation tools, according to swedish norms, should be used.
- 9) We hope, the example of the house to house examination in Porto Branco and the interviews with the inhabitants will make school, because the near by won statistic proofs are of great importance and because the concerned inhabitants profit themselves.
- 10) The medicins, biologists, physicians, biophysicians, etc. are invited to interdisziplinary co-operation.
